

# Mounting Safety Skirts

A collar is provided at the top of the guard for mounting purposes. The collar can be sandwiched against the table with a customer supplied piece of flat bar secured with screws, bolts or pop rivets. The collar can also be fastened directly to the table without the flat bar.

A mesh fold is provided near the top of the bellow for air flow.

A pocket is provided on the bottom of the guard that can be weighted or anchor bolted to the floor.

With the lift table at a raised height place one end of the safety bellow over one end of the table, leave some slack while the opposite end of the safety bellow is raised over the opposite end of the table and attached. With opposite ends attached you can attach opposite sides.

BellowTech can manufacture lift table guards with the collar sewn to the inside or the outside. The inside mount has the convolutions running to the inside which places all the convolutions under the table. This mount is commonly used on pit mounted lifts accommodating the machinery so the convolutions will not interfere with the scissor action of the lift.
